

LENSBABY PL

Our Lensbaby help you create desired out of focus effects

Lensbaby PL is the hybrid love child of an old-fashioned bellows camera and an up-tight, tilt-shift lens. Lensbaby allows precise focus control.

Featuring a low dispersion, multi-coated optical glass doublet, the Lensbaby delivers images with a tack-sharp sweet spot.

Seven different iris disks allow aperture settings between T2 and T22.

How to use the Lensbaby:

Focus your Lensbaby by compressing the lens with your fingers until your subject comes into focus. Then you can move the sweet spot of sharp focus around the image by bending the lens. When the sweet spot is sharp and placed where you want, press the Locking Button on the Focusing Collar to lock your Lensbaby into place. You can then make precise adjustments to your focus by rotating the Fine Focusing Ring. You can also adjust the sweet spot's placement by rotating the metal rods.

The Lensbaby PL kit includes three focal lengths:

30 mm / T2 · 50 mm / T2 · 80 mm / T2

Optics Multi-coated optical glass doublet

Focus Manual/Fingertip with two additional types of fine focusing

Iris Interchangeable levitating aperture discs

If you'd like to run some tests with our Lensbaby before your next important shoot, give us a call.
